SKILLS

GPU & AI Infrastructure: NVIDIA GPU Operator, DCGM, drivers/CUDA, MIG, vLLM inference serving, GPU SLOs and observability
Infrastructure & Networking: Kubernetes (GKE, bare-metal), Helm, Kustomize, FluxCD, ArgoCD, Terraform, OpenTofu, Ansible, VPC, Cloud DNS, Traefik, Linkerd, GCP, AWS, Hetzner, OVH, Cloudflare
Secrets and Auth: GCP Workload Identity Federation, External Secrets Operator (ESO), GCP Secret Manager, cert-manager, Pomerium
CI/CD and Observability: GitHub Actions, self-hosted ARC runners, Trivy, SonarQube, TruffleHog, Renovate; Prometheus, Grafana, Mimir, Loki, Tempo, Grafana Alloy, grafana-operator, Alertmanager
Development: Golang, Python, FastAPI, Bash, Node.js, TypeScript, PostgreSQL, Linux

PROFESSIONAL EXPERIENCE

ONE2N

Pune, Maharashtra, India

Senior SRE & Team Lead • Client: Fravity AI (Remote)

May 2026 - Present

- Built **fravity-spine**, the production multi-tenant GKE platform powering an AI product: private control plane, CMEK etcd, Workload Identity Federation, OpenTofu across **6** isolated state layers. Replaced bastions and shared SSH with identity-based **kubectrl** via GKE Connect Gateway + Workspace SSO; FluxCD-bootstrapped cert-manager, ESO, Traefik, and Pomerium SSO.
- Led multi-cloud account governance across **5** GCP and **5** AWS accounts: assessed security, IAM, and cost posture (surfaced **19** service-account keys, ~\$26,520/yr of zombie spend), then drove the hardening across the **2**-engineer team I lead: all human and **10** workload identities migrated to Terraform IAM-as-code, CI rebuilt on keyless Workload Identity Federation, IaC bootstrapped to **60%** across **2** envs.
- Delivered the central LGTM observability platform: Mimir + Loki + Tempo (GCS-backed, multi-tenant via X-Scope-OrgID) as authenticated public ingest. Migrated to grafana/alloy single-agent (logs, metrics, traces) across spine and the fravity-dev1 spoke; Grafana unified alerting to Slack; grafana-operator CRDs for dashboards-as-code.
- Stood up a **5**-tool SAST stack on self-hosted ARC runners and shipped **scan-aggregator** (normalises **7** scanners to a per-repo audit); delivered a customer security review surfacing **76** H/C findings across **4** images.
- Onboarded the **workflow-engine** and isolated its multi-tenant PubSub from a same-project legacy environment via attribute-filtered subscriptions, staging the destructive cutover to avoid downtime.
- Delivered staging on **fravity-dev1** GKE as a commit-to-URL GitOps pipeline: CI build, Flux image-automation, a live TLS endpoint, and Slack deploy alerts, all **keyless** via per-app Workload Identity. Ended staging schema drift by locking the database to **automation-only** writes with **Atlas** migrations as the single source of truth.
- Shipped the first client MVP on a hardened, fully **IaC** GCE VM (shielded, no public IP, **IAP**-only SSH, snapshotted regional SSD, per-VM least-privilege SA) fronted by a **Cloudflare** tunnel. Built its keyless build-to-deploy pipeline (**WIF** image builds to a central registry; IAP-tunneled, static-key **Ansible** reconcile) and took the app live behind app-native SSO, the org's first reusable VM-deploy blueprint in an otherwise all-Kubernetes estate.

LUXOR TECHNOLOGY

Seattle, WA, US

DevOps Engineer (Remote)

June 2023 - April 2026

- Operated a multi-cluster Kubernetes platform for **20+** teams and **3,000+** enterprise customers: **8+** clusters across Hetzner, OVH, and GCP with **24/7** uptime for L1/L2 validator and RPC workloads, including **2** Hetzner bare-metal HA clusters (KubeOne, OpenEBS) built from scratch. Standardised on a **7**-layer FluxCD GitOps pipeline with Linkerd mTLS; migrated **70+** SOPS secrets to GCP Workload Identity.
- Owned the on-call and incident platform: migrated **5** teams from Opsgenie to BetterStack (runbooks, escalation, multi-channel alerting, Prometheus/Grafana-fed). Led response through real outages including a Litecoin hard fork (**zero-downtime** deploy) and a kubelet TLS expiry, and shipped x509 monitoring across **10** clusters with **7-day/24-hour** alerts.
- Owned CI/CD for **50+** repositories on self-hosted ARC runners. Ported a failing Playwright E2E suite from Mac hosted runners (\$5,000/mo) to Linux ARC, cutting runtime **40 to 15 min** and cost to **\$600/mo**. Built code-signed Windows + Mac release pipelines and automated FluxCD deployments to GCP Artifact Registry.
- Built org-wide platform tooling: **KubeOrbit** (Go CLI for kubeconfig provisioning across **20+** clusters) and **Memphis** (Python SOC1/2/SOX compliance binary with auditor-ready Drive reports + Linear escalation; solo, **4 weeks** for the planned IPO). Prevented a supply-chain compromise by vendoring Trivy into a composite action across **9** repos; when CVE-2026-33634 later hit aquasecurity/trivy-action, Luxor pipelines were untouched.
- Proposed and built **BVT**, the org's first zero-hardcoded-secrets cluster: replaced SOPS-in-git with ESO + GCP Secret Manager + Workload Identity Federation; the pattern became the gold standard for new clusters. Authored custom Python tooling against Hetzner + OVH firewall APIs to enable secure cross-cloud peering for bare-metal nodes where no Terraform modules existed.

TATA CONSULTANCY SERVICES

Hyderabad, Telangana, India

Systems Engineer (Remote)

October 2020 - June 2023

- Migrated **2,500+** repositories (GitLab, Bitbucket, SVN) to GitHub Enterprise for **120** teams and built their CI/CD pipelines, saving **15 weeks** of manual effort.
- Built PowerShell and Python automation across **22** RHEL/WebLogic servers (health checks, alerting, Oracle DB replication), saving **380+ man-hours/month**.
- Shipped a **Golang** CLI that cut HP storage provisioning from **30 man-hours** per ticket to one command, adopted by the storage team as their primary interface.

PROJECTS

- Frit** (May 2026 - Present)  - GPU SRE lab: vLLM on NVIDIA GPU Operator; OSS PRs to **dcgm-exporter** + **gpu-operator**.
- Platform Zero** (Apr 2026 - Present)  - **4** SRE labs (k8slab, ansiblelab, awslab, gcplab); **0-to-100** in one command.
- Truss** (Jun 2026 - Present)  - Open-source, self-hostable Backend-as-a-Service (Supabase/Appwrite alternative): Postgres, auth + fine-grained authz + OAuth2 (**Ory**), S3 storage, Valkey cache; instrumented with Prometheus + OpenTelemetry, one-command **OCI Helm** install, and an **MCP server** to drive it from an AI agent.

TEACHING EXPERIENCE

- Full-Stack Instructor, **4** cohorts (2022-2026), taught NextJS, FastAPI, and DevOps to BSc CS students.
